24. Which of the following statements about some of the subfields of AI are true?

- ☒ A. Computer vision is a science that studies how to make computers "see" things.
- ☒ B. Speech processing is a general term for different speech processing technologies, such as the study of vocalization, the collection of statistics related to speech signals, speech recognition, machine synthesis, and speech perception.
- ☒ C. Natural language processing (NLP) studies how to use computer technology to understand and use human languages.
- ☐ D. Autonomous driving does not require speech processing or computer vision.

21. Which of the following statements about the L1 buffer is true?

- ☐ A. Data in the L1 buffer needs to be read outside the AI Core over the bus interface each time.
- ☐ B. The L1 buffer can permanently retrain data that needs to be reused.
- ☒ C. The L1 buffer decreases data accesses over the bus and avoids bus congestion.
- ☐ D. L1 buffer is used to store the initial values in the neural network.

7. Which of the following statements is false about support vector machines (SVMs)?

- ☐ A. SVMs are classification models. Their basic model is the linear classifier that maximizes the width of the gap between the two categories in the feature space.
- ☐ B. SVMs also have a kernel trick, which makes them non-linear classifiers.
- ☐ C. In the case of linear inseparability, non-linear mapping algorithms are used to convert the linearly inseparable samples of low-dimensional input space into samples of high-dimensional feature space. In this way, samples become linearly separable.
- ☒ D. SVMs only apply to linear classification.

- ☐ B. The chip-oriented deep graph optimization is used to reduce synchronization waiting time and maximize the parallelism degree of computing communication". The training performance is equivalent to that of the graph scheduling mode on the host.
- ☐ C. Challenges to distributed gradient aggregation with powerful chip computing power.

When a single iteration of ResNet-50 takes 20 ms, the central control overhead and communication overhead for frequent synchronizations are generated. The traditional method requires three times of synchronization to complete AllReduce. The data-driven method only performs AllReduce without control overhead.

- ☐ D. MindSpore uses gradient-driven adaptive graph optimization to implement decentralized and autonomous All Reduce. The gradient aggregation step is consistent, and computing and communication are fully streamlined.

21. Which of the following statements about the L1 buffer is true?

- ☐ A. Data in the L1 buffer needs to be read outside the AI Core over the bus interface each time
- ☐ B. The L1 buffer can permanently retain data that needs to be reused
- ☒ C. The L1 buffer decreases data accesses over the bus and avoids bus congestion
- ☐ D. L1 buffer is used to store the initial values in the neural network

26. Which of the following statements about data preprocessing are true?

- ☐ A. Data cleansing is a process of filling in missing values, as well as detecting and eliminating noise data and exceptions
- ☒ B. The purpose of data dimension reduction is to simplify data attributes and avoid the curse of dimensionality.
- ☒ C. The purpose of data standardization is to reduce noise data and improve model accuracy by standardizing data.
- ☐ D. Machine learning outputs results through models. Therefore, model training is more important than data preprocessing

25. Which of the following statements about some of AI use case are true?

- ☒ A. Smart home uses technologies such as the Internet of Things (IoT) and speech recognition
- ☒ B. Smart healthcare uses AI technologies such as computer vision and data mining
- ☐ C. Smart city is a comprehensive domain, covering all three basic technology fields of AI speech, NLP, and computer vision
- ☒ D. Smart education features openness, sharing, interaction, collaboration, and ubiquity. It aims to modernize education and upgrade traditional teaching methods with information technologies.

31. Which of the following statements are true about commonly used optimizers?

- ☐ A. The momentum optimizer updates parameters with the same learning rate, while the momentum coefficient is adjusted with each iteration.
- ☒ B. The idea behind the Adagrad optimizer is to set different learning rates for different parameters.
- ☒ C. One drawback of the Adagrad optimizer is that it ends the optimization process too early.
- ☒ D. The RMSProp optimizer introduces an attenuation coefficient to enable the gradients to attenuate by a certain proportion in each round.
