

– SMART Goal for My Career Path –

S – Specific: What do you want to accomplish?

I want to become a Data Scientist specialized in genetics and biomedical research and secure a position at the Medical Research and Regenerative Medicine Center of the Egyptian Armed Forces, contributing to genetic analysis, disease prediction models, and medical research projects.

M – Measurable: How will you track your progress?

Completing the Digilians 9-Month AI & Data Science Diploma.

Building 3–5 genetics-focused data science projects (DNA sequencing analysis, gene expression, disease prediction).

Earning key certifications (Python, Machine Learning, Statistics, Bioinformatics basics).

Creating a strong portfolio + LinkedIn profile relevant to biomedical data.

Applying to internships or volunteering in labs or research teams.

A – Achievable: Is this goal realistic?

Yes.

I already have a background in data tools (Python, Power BI, Excel, Google Sheets) and I'm currently studying AI & Data Science. With additional training in bioinformatics and genetics datasets, this goal is realistic and achievable within a structured timeline.

R – Relevant: Why is this goal important to you?

Because I'm passionate about using data to improve human health, especially through genetic research and medical innovation. Working in this field will let me contribute to scientific discoveries that can help treat diseases and support national-level medical research.

T – Time-Bound: What is the timeframe to achieve this goal?

0–9 months: Complete the AI & Data Science diploma and start genetics-focused projects.

9–18 months: Build a strong bioinformatics/data science portfolio and gain practical experience.

18–24 months: Apply for roles at the Medical Research and Regenerative Medicine Center and other biomedical research institutions.
