

Which regularization technique is MOST effective at handling multicollinearity?

- ☐ a. Ordinary Least Squares
- ☒ b. Ridge (L2)
- ☐ c. Elastic Net
- ☐ d. Lasso (L1)

Discuss how underfitting and overfitting are related to bias and variance.

Answer text Question 2

Which classification type assigns **exactly one label** out of more than two possible classes?

- ☐ a. Binary Classification
- ☒ b. Multi-Class Classification
- ☐ c. Multi-Label Classification
- ☐ d. Clustering

Polynomial regression is considered a form of linear regression because:

- ☐ a. It uses one feature only
- ☐ b. None of them
- ☐ c. It predicts linear outputs
- ☒ d. It is linear in the parameters

Multicollinearity occurs when _____.

- ☐ a. The model underfits the data
- ☒ b. Independent variables are highly correlated with each other
- ☐ c. Noise in the dataset is zero
- ☐ d. The dependent variable is highly correlated with the target

You have a feature **Size** = {XS, S, M, L} with a natural order.
Which encoding is MOST appropriate?

- ☐ a. One-hot Encoding
- ☒ b. Ordinal Encoding
- ☐ c. Count Encoding
- ☐ d. Label Encoding
